Summary

Senior Software Engineer with 5+ years building production web applications in TypeScript end to end, with depth in frontend architecture and web performance. Delivered measurable gains on high-traffic, SEO-critical platforms, including a 55% reduction in main-thread execution time and a 30% reduction in third-party search API requests — both confirmed in production through structured telemetry rather than assumed. Led two legacy migrations end to end and built a full-stack marketplace solo, from payments to production. Work with AI coding agents daily and shipped a production RAG product on top of them. Five years of remote work with teams in the US, Norway and Brazil. English C2.

Technical Skills

Core: TypeScript, React, Next.js (App Router, Server Components), Node.js, PostgreSQL
Frontend: React Native, Vue with Vuex, Redux Toolkit, Zustand, TanStack Query, SSR/SSG/ISR, Web Performance, Core Web Vitals, Technical SEO, Structured Data (Schema.org / JSON-LD), Tailwind CSS, shadcn/ui, Sanity CMS, i18n / internationalization
Backend & Data: NestJS, Express, REST APIs, GraphQL, GROQ, Prisma, Redis, Supabase, MongoDB, Firebase, PostGIS, Postgres RLS, WebSocket, MQTT
Testing: Jest, Playwright, Vitest, React Testing Library, Storybook, end-to-end and integration testing
Delivery: AWS (EC2, S3, Cognito, Route 53, ECR, IAM, SSM), Terraform, Docker, Docker Compose, GitHub Actions, CI/CD, PM2, Azure Application Insights
AI: AI-assisted development with agentic coding tools as daily practice, agentic workflows with verification and structured output, LLMs, RAG, pgvector, embeddings, tool calling

Experience

Bucksense **07/2024 – 07/2026**
Software Engineer (Contract) *New York, USA – Remote*

- Full-stack engineer on two high-traffic, SEO-critical booking platforms for the luxury travel sector, a Next.js and Sanity CMS codebase of approximately 1,500 components and 200+ routes serving both direct guests and a B2B travel-agent portal, working alongside 8 to 10 engineers.
- Built and owned Next.js API routes as the integration layer between the web applications and third-party booking, shopping and marketing systems, with session-aware authorization, request validation, typed responses and structured telemetry on every success and failure path.
- Designed voyage data queries in GROQ over Sanity, including a similar-voyage endpoint that aggregates fares across suite categories and early-booking tiers and joins itineraries, ports, excursions, suites and ship data in a single query.
- Owned voyage comparison end to end, from the recommendation endpoint and cross-page comparison state to a generated PDF comparison document, integrated into the search results and the request-a-quote funnel.
- Reduced third-party search API requests by approximately 30% by eliminating redundant queries and introducing Redis caching, and moved search results to server-rendered state with progressive client hydration. Instrumented the flow with structured events that distinguished an API response from a cached one, so the 30% was measured in production rather than assumed.
- Implemented booking domain rules on the server, including reservation age eligibility, guest information form variations and blocking changes on departed voyages, across shore excursion, dining and spa reservations.
- Reduced a key page bundle from 1.62 MB to 781 KB and cut main-thread execution time by approximately 55%, from 10.4s to 4.7s, and drove Core Web Vitals work across the catalog, raising the Lighthouse performance score by approximately 20 points on pages where organic search was the primary acquisition channel. The work started in the profiler, which showed the cost concentrated rather than spread, so the fix was targeted instead of a rewrite.
- Implemented the structured-data layer as part of an Answer Engine Optimization initiative, modelling voyages, destinations and ships as Schema.org JSON-LD across CMS-driven pages, and eliminated recurring SSR hydration mismatches that had destabilized server rendering on the highest-traffic pages.
- Set up GitHub Actions pipelines enforcing lint, format and automated test gates, owned releases across sandbox, QA and production environments using PM2, and monitored production health through Azure Application Insights dashboards used by company leadership.

Gudi Marketplace **02/2025 – Present**
Software Engineer (Contract) *Brazil – Remote*

- Sole engineer on a cultural-events marketplace, built solo from scratch and shipped end to end across web, mobile, backend and infrastructure.
- Designed payment orchestration supporting split payments, seller payouts, virtual wallet credits and platform revenue distribution, including handling of asynchronous provider callbacks, and kept domain rules separate from the provider integration so the provider can change without rewriting the rules.
- Architected a multi-role PostgreSQL schema with Supabase RLS and PostGIS, enforcing authorization at the database layer rather than scattering permission checks through the clients, and supporting location-based discovery and expansion across cities.
- Built the ticketing flow end to end, from purchase to QR code generation and scan-based validation at venue entry, and shipped web (Next.js) and mobile (React Native) from one shared TypeScript codebase.

Quattrus **01/2024 – 08/2024**
Software Engineer *Porto Alegre, Brazil*

- Led the frontend modernization of enterprise applications on an 8-person engineering team, defining the target architecture and migration strategy from ExtJS to Next.js and eliminating legacy licensing costs — migrated incrementally, with the legacy system serving production throughout.
- Built a private npm package of shared UI components adopted by 2 migrated applications, defining the component API other engineers built against, and implemented internationalization across the migrated applications.
- Designed a hybrid SSR/SSG architecture with caching strategies, improving application performance by approximately 40%.
- Worked directly with product leadership to turn requirements into technical decisions and align stakeholders with competing priorities, and ran code reviews and technical mentoring.

Alex Rohleder LTDA **03/2023 – 01/2024**
Software Engineer (Contract) *Norway – Remote*

- Contributed to the migration of a Create React App codebase to Next.js using a hybrid rendering architecture, consolidating duplicated application logic into a Webpack monorepo with shared modules for transactional email and internationalization, and strengthening automated testing on an inherited codebase that had no coverage.

Speedcast **02/2022 – 04/2023**
Software Engineer (Contract) *Virginia, USA – Remote*

- Built real-time monitoring and data-visualization features **in Vue with Vuex** for a satellite network platform, including ArcGIS-based geospatial visualization where markers, layers and visual states were driven by status and alarms, and data-processing modules that flattened nested 1:N structures into CSV and XLSX reports over thousands of operational records.

Switch App **10/2021 – 02/2022**
Junior Software Engineer *Brazil – Remote*

- Built React and Node.js features for a hospitality recruitment platform with PostgreSQL, improving payment processing and document generation workflows.

Lucalto **01/2021 – 09/2021**
Junior Software Engineer *Oslo, Norway – Remote*

- Built core features with Next.js and Supabase, including authentication flows and database models, contributing to the launch of a social platform for tattoo artists.

Selected Projects

FlowHall
Multi-tenant WhatsApp customer-service SaaS – own product, pre-launch *Architecture*

- Designed and built a multi-tenant B2B SaaS (shared inbox, role-based access control, bulk messaging campaigns) as a modular monolith in **NestJS**, Next.js and PostgreSQL, with the tenant resolved from the hostname and enforced in every query. A first organization is evaluating it for a pilot.
- Provisioned the **AWS** infrastructure with **Terraform**: EC2 (Graviton), S3, Cognito, Route 53, ECR, IAM and SSM, with no SSH and a least-privilege instance role; the data layer is ready for a planned move to RDS.
- Handled concurrency in the database: conditional updates instead of locks when agents compete for a conversation, a PostgreSQL job queue with `SKIP LOCKED` for campaigns, and real-time WebSocket events published only after commit.

WishApply
AI Career Assistant – Chrome Extension *wishapply.com*

- Built an AI-powered Chrome extension that analyzes job opportunities and personalizes application content.
- Designed specialized AI agents for job-fit analysis, CV tailoring and contextual Q&A, using RAG over candidate profile and CV data with Supabase and **pgvector** to ground generated content in verified experience. The first design concatenated questions into a single embedding and suffered retrieval dilution, so I rebuilt it with per-question embeddings, chunk deduplication and round-robin context budgeting, and added a verification step that checks grounding before any output reaches the page.

Workspace Reservation System
Full-stack + IoT technical assessment, built in 2 days *GitHub*

- Built a reservation API in Express, Prisma and PostgreSQL with domain-level business rules, conflict validation, pagination and API key authentication, plus a React frontend with a real-time telemetry dashboard.
- Ingested device telemetry over **MQTT** with wildcard topic subscriptions and broadcast it to clients over **WebSocket**, eliminating polling. Containerized with separate **Docker Compose** environments for development, testing and production, an optional requirement of the assessment.

Education

B.S. in Software Engineering — UNINTER 2025
Technologist Degree in Systems Analysis and Development 2023
